#### Abstract

The crystal and molecular structure of the title compound was elucidated. The structure was solved by direct methods and refined anisotropically to $R=0.0393$ for 1577 unique observed reflections. The crystal is monoclinic, $\mathrm{P} 2, / \mathrm{c}, a=12.036(2) 10^{-10} \mathrm{~m}, b=12.3257(11) 10^{-10} \mathrm{~m}, c=9.3466(12) 10^{-10} \mathrm{~m}$, $\beta=102.719(12)^{\circ}, Z=4$. The presence of one from possible tautomeric structures has been proved using X-ray diffraction. The structure is stabilized by intermolecular hydrogen bonds.

On the basis of the systematic study of nitrogenous heterocyclic compounds we were concerned with preparation and reactions of 3,5-disubstituted 6-oxo-1,6-dihydro-1,2,4-triazines in our previous works [1-6]. From reactions of these substances it is evident that they exist in a few tautomeric forms [7]. Some of possible tautomeric structures are shown in Scheme 1. For this reason we decided to solve the crystal and molecular structure of 3-phenyl-5-benzyl-6-oxo-1,6-di-hydro-1,2,4-triazine ( $/$ ) as a starting substance.

## EXPERIMENTAL

3-Phenyl-5-benzyl-6-oxo-1,6-dihydro-1,2,4-triazine (I) was synthesized according to the procedure described in [8]. Crystals for X-ray structural analyses were obtained by recrystallization from an ethanolbenzene (1:1) mixture. The experimental density was estimated by the flotation method in a $\mathrm{H}_{2} \mathrm{O}-\mathrm{KI}$ mixture.

Diffraction experiment was performed on a KUMA KM-4 four-circle diffractometer at 293 K using graphitemonochromatized MoK $\alpha$ radiation ( $\lambda=0.7107310^{-10}$ m ) and a crystal with dimensions of $0.60 \mathrm{~mm} \times 0.45 \mathrm{~mm}$ $\times 0.30 \mathrm{~mm}$. Lattice parameters were refined using 50 reflections in the range $23.8^{\circ}<2 \theta<41.0^{\circ}$. Intensities were measured with $\omega$ - $2 \theta$ scan technique within the $4.8^{\circ}<$ $2 \theta<50.2^{\circ}$ region. Index ranges: $-14 \leq h \leq 14,0 \leq k \leq$ $14,-11 \leq I \leq 0$. The three standard reflections (430, - $24-3,-244$ ) were checked after every 80 measurements (the e.s.d.'s were slighter than $1.5 \%$ ). Extinction and absorption corrections were not applied.

The phase problem was solved by direct methods and the structure was anisotropically refined by the fullmatrix least-squares procedure with weighting scheme $w=1 /\left[\sigma^{2}\left(F_{0}^{2}\right)+(0.065 P)^{2}+0.25 P\right]$, where $P=\left(F_{0}^{2}+\right.$ $\left.2 F_{c}^{2}\right) / 3$. All hydrogen atom positions were found from the difference Fourier synthesis and were refined isotropically. The maximum and minimum electron densities on the final difference Fourier map were $1.50 \times$

Scheme 1
$10^{29}$ and $-1.30 \times 10^{29} \mathrm{e} \mathrm{m}^{-3}$. Other maxima were found inside the phenyl, benzyl, and triazine ring, respectively. Refinement of the structure was based on $F^{2}$. The weighted $R$-factor, $w R$, and goodness of fit, $S$, were based on $F^{2}$ The conventional $R$-factor, $R$, was based on $F$. The observed criterion of $I>2 \sigma(I)$ was used only for calculation of $R_{\text {obs }}$ and $w R_{\text {obs }}$, respectively , and is not relevant to the choice of reflections for refinement. The following programs were used: SHELXS-86 [9], SHELXL-93 [10], PARST [11], and ORTEP [12].

## RESULTS AND DISCUSSION

The basic crystallographic data and structure refinement parameters are given in Table 1. The final coordinates and equivalent isotropic thermal parameters of non-H atoms are summarized in Table 2. Complete set of bond distances and angles is listed in Tables 3 and 4.

The molecular structure of the compound studied (Fig. 1) confirms the presence of a single tautomer in solid state. The distance $\mathrm{C}(6)-\mathrm{O}(7)\left(1.233(2) 10^{-10}\right.$ m ) is typical for the double bond [13] (Table 3) and the same is valid for the bond lengths $\mathrm{N}(2)-\mathrm{C}(3)$ (1.306(2) $10^{-10} \mathrm{~m}$ ) and $\mathrm{N}(4)-\mathrm{C}(5)\left(1.290(2) 10^{-10} \mathrm{~m}\right)$, respectively.

The six-membered triazine ring deviates significantly from planarity (the value of $\sum(d / s)^{2}$ for the $N(1), N(2)$, $\mathrm{C}(3), \mathrm{N}(4), \mathrm{C}(5)$, and $\mathrm{C}(6)$ atoms is 214.8 ; the value of $\chi^{2}$ at $95 \%$ probability level is 7.8 ). The $N(1), N(2), C(3)$, $C(5)$, and $C(6)$ atoms displaced by $-0.005(2) 10^{-10} \mathrm{~m}$, $-0.006(2) 10^{-10} \mathrm{~m}, 0.012(3) 10^{-10} \mathrm{~m},-0.014(2) 10^{-10} \mathrm{~m}$, and $0.016(2) 10^{-10} \mathrm{~m}$, respectively, from the leastsquares plane fitted through the $\mathrm{N}(1)-\mathrm{N}(2)-\mathrm{C}(3)-$ $\mathrm{N}(4)-\mathrm{C}(5)-\mathrm{C}(6)$ atoms (plane 1). The $\mathrm{N}(4)$ atom lies

Fig. 1. View of a molecule of the triazine with atom numbering. Thermal motion is shown by ellipsoids at the $50 \%$ probability level.

Fig. 2. A stereoscopic view showing molecular packing in crystal. Dashed lines indicate the hydrogen bonding.
in this plane. The remaining two six-membered rings, i.e. phenyl ring (plane 2) and benzyl ring (plane 3), are situated in different planes. The dihedral angles formed by least-squares planes are as follows: (plane 1-plane 2) $6.51(7)^{\circ}$, (plane 1-plane 3) $73.07(6)^{\circ}$, (plane 2plane 3) $77.78(7)^{\circ}$ The molecules are linked together by $\mathrm{N}-\mathrm{H} . . \mathrm{O}$ hydrogen bonds involving the $\mathrm{N}(1)$ atom and the $\mathrm{O}(7)$ atom (the $\mathrm{N}(1) \ldots \mathrm{O}(7)^{i}$ interatomic contact is equal to $2.787(2) 10^{-10} \mathrm{~m}$ ) of the neighbouring molecule $\left(\mathrm{H}(1) \ldots \mathrm{O}(7)^{i}=1.79(2) 10^{-10} \mathrm{~m} ; i:-x,-y+1\right.$, $-z)$. The latter distance also represents the shortest intermolecular contact, which has been observed in this structure. A stereoscopic view showing the structure and crystal packing of the compound is displayed in Fig. 2. Intermolecular hydrogen bonds are indicated by dashed lines.
